

Forklift Fork Positioners

Fork Positioner for Forklifts - The fork positioner is a hydraulic apparatus which can allow the driver to control the forklift without leaving the seat. They are made out of high quality materials and are intended to endure the most difficult procedures and work surroundings. Side shifting units have the extra ability to be able to laterally position the entire load or the arms in order to facilitate much more precise lifting and position in a faster and much more efficient manner.

The unique fork pocket design could enable the person operating it to safely swing the unit's forks without any fear of destroying the positioning cylinders. This can allow the worker the choice to either execute independent or simultaneous fork movement, depending on the job requirement. For most lift trucks with non-OEM carriages, complete carriages are considered necessary. Standard OEM carriages can be transformed into blade positioners on available units.
